

WeatherAPI.com Code Challenge

Challenge Description

Using the **WeatherAPI.com API**, retrieve a forecast for the next day for the following cities: **Chisinau, Madrid, Kyiv, and Amsterdam**.

Requirements

- The app should be written in Java (bonus points if written in Kotlin).
- The code should be tracked with git and pushed to Github or Bitbucket.
- The data for the next day's forecast should be outputted to STDOUT.
- The output should be formatted as a table with the dates as columns and the cities as rows.
- The table should show the following data points for each location:
 - Minimum Temperature (°C)
 - Maximum Temperature (°C)
 - Humidity (%)
 - Wind Speed (kph)
 - Wind Direction

How to Use the WeatherAPI.com API

To get started with the WeatherAPI.com API, you'll need to follow a few simple steps:

1. **Create an Account:** Go to the [WeatherAPI.com website](https://weatherapi.com) and sign up for a free plan. The free plan provides access to real-time, forecast, and historical weather data.
2. **Obtain an API Key:** Once you've created an account, you'll find your unique **API key** on your account dashboard. This key is a unique identifier that authenticates your requests. You'll need to include this key as a query parameter in every API call you make.
3. **Explore the API Documentation:** The best way to understand the API is by using their interactive documentation, specifically the [Swagger tool](https://openapi.weatherapi.com). This tool allows you to test different endpoints, see the required parameters, and view example JSON responses. This will be very helpful in structuring your application's data models.

Bonus Points

- Writing the app in Kotlin.
- Using Gradle as a package manager.
- Using Retrofit (<https://square.github.io/retrofit/>) for API interaction.
